PROFILE

Full Stack Developer with four years building web applications and, above all, operating them after delivery. I currently keep in production an AI assistant that books medical appointments every day, a store migrated off Shopify, and a training platform with seat control and payments. I work the full cycle —Next.js and React on the front end, Node and PostgreSQL on the back end, and the infrastructure that holds it up—. My background in Industrial Engineering is why I start from the business problem rather than the framework.

EXPERIENCE

Full Stack Developer · Founder

Jul 2022 — Present

Lopezoft · Pereira, Colombia

- I build and operate the platforms of the company's clients end to end: product, code, deployment and infrastructure. **Four systems in production today** across healthcare, education, e-commerce and facilities management, in Colombia and the UK.
- Responsible for operations: deployments, daily backups, SSL certificates, monitoring and **production log auditing** — which is where the failures that give no symptom show up.
- Architecture and data modelling, integration with third-party APIs (payment gateways, messaging, client management systems) and business process automation.
- Direct client contact through the whole cycle: discovery, proposal, delivery, training and support. Several of these systems are administered by the client without depending on me.

Founder and General Manager

Dec 2015 — Feb 2022

G3 Seguridad · Pereira, Colombia

- Founded and ran an electronic security hardware distributor **operating in five cities** across the country.
- Led the sales, logistics and administration teams, and answered for the full operation of the business and its payroll.
- Negotiated with national and international suppliers and optimised the company's commercial and logistics processes.

Process analyst (intern)

May 2014 — Jan 2015

Servientrega S.A. · Pereira, Colombia

- Time and motion study in the logistics area. I developed an algorithm measuring delivery time and effort per regional zone in order to implement a productivity-based pay model.

SELECTED PROJECTS

WhatsApp AI Assistant — dental clinic

private project

Claude AI (tool calling) · WhatsApp Business API · Dentalink API · Firebase Cloud Functions · Firestore · React

An assistant that converses in natural language and **writes into the clinic's real calendar**: it registers patients, books, reschedules and cancels appointments respecting duration, chair availability and opening hours. In daily operation throughout 2026. Auditing its production logs I found **25 messages undelivered to 12 patients in 7 days** that the panel showed as sent; I fixed it with automatic retries, alerts to the administrator, scheduled recovery and traceability of the real failure reason.

JPR Academy — training platform

jprdesigntraining.com

Next.js 15 · Payload CMS 3 · PostgreSQL · Wompi · Bunny Stream · Cal.com · n8n

Seat control per cohort and per pass type, with each student's access frozen on payment; payments verifying the webhook signature; a members area with content gated by pass; self-service upgrades paying only the difference. **It sold 9 of the 10 Elite passes in its first cohort** and avoided an overselling incident a manual panel would not have caught.

Café Montelargo — headless e-commerce

cafemontelargo.com

Next.js 15 · Headless WordPress (WPGraphQL) · WooCommerce REST · Wompi · PostgreSQL · n8n · Vercel

Migration from Shopify to an owned storefront. The order total is recomputed server-side from the catalogue and orders live in PostgreSQL as the source of truth, mirrored to WooCommerce so the owner manages their own coupons. Five sales automations in production. **Removed the per-sale commission and the 2% surcharge** of the external gateway, without losing the domain or the email.

GCP Facilities Management — United Kingdom

gcpfm.co.uk

WordPress · Divi · REST API · Python

Built the full 28-page corporate site from scratch with WordPress and Divi, then engineered its maintenance through the API: with no server, cPanel or DNS access, bulk changes are applied by custom Python scripts against the WordPress REST API. 192 calls to action normalised with automated zero-failure verification, and a header flicker diagnosed and removed across all 28 pages. Project run in English.

TECH STACK

Frontend	React · Next.js · Angular · TypeScript · JavaScript · Tailwind CSS · HTML5 and CSS3
Backend & data	Node.js · Express · Nest.js · PostgreSQL · MongoDB · MySQL · REST APIs · JWT
AI & automation	Claude AI API (tool calling) · WhatsApp Business API · Firebase Cloud Functions · n8n
Infrastructure & CMS	Vercel · Docker · Firebase · Headless WordPress · Divi · Git and GitHub

EDUCATION

Industrial Engineering — Universidad Tecnológica de Pereira · GPA 4.2/5.0, distinguished student	2009 — 2014
React from Zero to Expert — Udemy (Fernando Herrera)	2025
Angular from Zero to Expert — Udemy (Fernando Herrera)	2022
HTML, CSS and JavaScript — Udemy (Víctor Robles)	2021

LANGUAGES

Spanish — native. **English** — technical reading and written communication; I currently work with a client in the United Kingdom. Conversational level in progress.
